- Homework 3: MDPs and Reinforcement Learning
  - Deadline: Nov 10th, 2020

# Today

- Probability

- Random Variables
- Joint and Marginal Distributions
- Conditional Distribution
- Product Rule, Chain Rule, Bayes' Rule
- Inference
- Independence

- You'll need all this stuff A LOT for the next few weeks, so make sure you go over it now!

Assignment Project Exam Help

<https://tutorcs.com>

WeChat: cstutorcs

# Uncertainty

- General situation:
  - **Observed variables (evidence):** Agent knows certain things about the state of the world (e.g. sensor readings or symptoms)
  - **Unobserved variables:** Agent needs to reason about other aspects (e.g. where an object is or what disease is present)
  - **Model:** Agent knows something about how the known variables relate to the unknown variables
- Probabilistic reasoning gives us a framework for managing our beliefs and knowledge

0.11	0.11	0.11
0.11	0.11	0.11
0.11	0.11	0.11

0.17	0.10	0.10
0.09	0.17	0.10
<0.01	0.09	0.17

<0.01	<0.01	0.03
<0.01	0.05	0.05
<0.01	0.05	0.81

# Random Variables

- A random variable is some aspect of the world about which we (may) have uncertainty
  - $R$  = Is it raining?
  - $T$  = Is it hot or cold?
  - $D$  = How long will it take to drive to work?
  - $L$  = Where is the ghost?
- We denote random variables with capital letters
- Like variables in a CSP, random variables have domains
  - $R$  in  $\{\text{true}, \text{false}\}$  (often write as  $\{+r, -r\}$ )
  - $T$  in  $\{\text{hot}, \text{cold}\}$
  - $D$  in  $[0, \infty)$
  - $L$  in possible locations, maybe  $\{(0,0), (0,1), \dots\}$

Assignment Project Exam Help

<https://tutorcs.com>

WeChat: estutorgs

# Probability Distributions

- Associate a probability with each value

- Temperature:

Assignment Project Exam Help

<https://tutorcs.com>

$P(T)$

T	P
hot	0.5
cold	0.5

WeChat: cstutorcs

- Weather:

$P(W)$

W	P
sun	0.6
rain	0.1
fog	0.3
meteor	0.0

# Probability Distributions

- Unobserved random variables have distributions

$$P(T)$$

T	P
hot	0.5
cold	0.5

$$P(W)$$

W	P
sun	0.6
rain	0.1
fog	0.3
meteor	0.0

Shorthand notation:

$$P(\text{hot}) = P(T = \text{hot}),$$

$$P(\text{cold}) = P(T = \text{cold}),$$

$$P(\text{rain}) = P(W = \text{rain}),$$

...

OK if all domain entries are unique

- A distribution is a TABLE of probabilities of values
- A probability (lower case value) is a single number

$$P(W = \text{rain}) = 0.1$$

- Must have:  $\forall x \ P(X = x) \geq 0$  and  $\sum_x P(X = x) = 1$

# Joint Distributions

- A *joint distribution* over a set of random variables:  $X_1, X_2, \dots, X_n$  specifies a real number for each assignment (or *outcome*):

$$P(X_1 = x_1, X_2 = x_2, \dots, X_n = x_n)$$

$$P(x_1, x_2, \dots, x_n)$$

- Must obey:  $P(x_1, x_2, \dots, x_n) \geq 0$

$$\sum_{(x_1, x_2, \dots, x_n)} P(x_1, x_2, \dots, x_n) = 1$$

- Size of distribution if  $n$  variables with domain sizes  $d$ ?
  - For all but the smallest distributions, impractical to write out!

$$P(T, W)$$

T	W	P
hot	sun	0.4
hot	rain	0.1
cold	sun	0.2
cold	rain	0.3

# Probabilistic Models

- A probabilistic model is a joint distribution over a set of random variables
- Probabilistic models:
  - (Random) variables with domains
  - Assignments are called *outcomes*
  - Joint distributions: say whether assignments (outcomes) are likely
  - *Normalized*: sum to 1.0
  - Ideally: only certain variables directly interact
- Constraint satisfaction problems:
  - Variables with domains
  - Constraints: state whether assignments are possible
  - Ideally: only certain variables directly interact

Distribution over T,W

T	W	P
hot	sun	0.4
hot	rain	0.1
cold	sun	0.2
cold	rain	0.3

Constraint over T,W

T	W	P
hot	sun	T
hot	rain	F
cold	sun	F
cold	rain	T

# Events

- An *event* is a set  $E$  of outcomes

$$P(E) = \sum_{(x_1 \dots x_n) \in E} P(x_1 \dots x_n)$$

Assignment Project Exam Help

- From a joint distribution, we can calculate the probability of any event

<https://tutorcs.com>

WeChat: cstutorcs

- Probability that it's hot AND sunny?
- Probability that it's hot?
- Probability that it's hot OR sunny?

$P(T, W)$

T	W	P
hot	sun	0.4
hot	rain	0.1
cold	sun	0.2
cold	rain	0.3

- Typically, the events we care about are *partial assignments*, like  $P(T=\text{hot})$

# Quiz: Events

■  $P(+x, +y)$  ?

■  $P(+x)$  ?

■  $P(-y \text{ OR } +x)$  ?

Assignment Project Exam Help

<https://tutorcs.com>

WeChat: cstutorcs

$P(X, Y)$

X	Y	P
+x	+y	0.2
+x	-y	0.3
-x	+y	0.4
-x	-y	0.1

# Marginal Distributions

- Marginal distributions are sub-tables which eliminate variables
- Marginalization (summing out): Combine collapsed rows by adding

$$P(T, W)$$

T	W	P
hot	sun	0.4
hot	rain	0.1
cold	sun	0.2
cold	rain	0.3

Assignment Project Exam Help

<https://tutorcs.com>

WeChat: cstutorcs

$$P(t) = \sum_s P(t, s)$$

$$P(T)$$

T	P
hot	0.5
cold	0.5

$$P(s) = \sum_t P(t, s)$$

$$P(W)$$

W	P
sun	0.6
rain	0.4

$$P(X_1 = x_1) = \sum_{x_2} P(X_1 = x_1, X_2 = x_2)$$

# Quiz: Marginal Distributions

$P(X, Y)$

X	Y	P
+x	+y	0.2
+x	-y	0.3
-x	+y	0.4
-x	-y	0.1

Assignment Project Exam Help

$$P(x) = \sum_y P(x, y)$$

WeChat: cstutorcs

$$P(y) = \sum_x P(x, y)$$

$P(X)$

X	P
+x	
-x	

$P(Y)$

Y	P
+y	
-y	

# Conditional Probabilities

- A simple relation between joint and marginal probabilities
  - In fact, this is taken as the *definition* of a conditional probability

$$P(a|b) = \frac{P(a, b)}{P(b)}$$

$P(T, W)$

T	W	P
hot	sun	0.4
hot	rain	0.1
cold	sun	0.2
cold	rain	0.3

Assignment Project Exam Help

<https://tutorcs.com>

WeChat: cstutorcs

$$P(W = s|T = c) = \frac{P(W = s, T = c)}{P(T = c)} = \frac{0.2}{0.5} = 0.4$$

$$\begin{aligned} &= P(W = s, T = c) + P(W = r, T = c) \\ &= 0.2 + 0.3 = 0.5 \end{aligned}$$

# Quiz: Conditional Probabilities

---

- $P(+x \mid +y)$  ?

$P(X, Y)$

X	Y	P
+x	+y	0.2
+x	-y	0.3
-x	+y	0.4
-x	-y	0.1

Assignment Project Exam Help

- <https://tutorcs.com>  
 $P(-x \mid +y)$  ?  
WeChat: cstutorcs

- $P(-y \mid +x)$  ?

# Conditional Distributions

- Conditional distributions are probability distributions over some variables given fixed values of others

Conditional Distributions

Assignment Project Exam Help

Joint Distribution

cold	rain	0.3

# Normalization Trick

$P(T, W)$

T	W	P
hot	sun	0.4
hot	rain	0.1
cold	sun	0.2
cold	rain	0.3

$$P(W = s|T = c) = \frac{P(W = s, T = c)}{P(T = c)}$$

$$= \frac{P(W = s, T = c)}{P(W = s, T = c) + P(W = r, T = c)}$$

$$= \frac{0.2}{0.2 + 0.3} = 0.4$$

$P(W|T = c)$

W	P
sun	0.4
rain	0.6

$$P(W = r|T = c) = \frac{P(W = r, T = c)}{P(T = c)}$$

$$= \frac{P(W = r, T = c)}{P(W = s, T = c) + P(W = r, T = c)}$$

$$= \frac{0.3}{0.2 + 0.3} = 0.6$$

Assignment Project Exam Help

<https://tutorsof.com>

WeChat: cstutores

# Normalization Trick

$$\begin{aligned}
 P(W = s|T = c) &= \frac{P(W = s, T = c)}{P(T = c)} \\
 &= \frac{P(W = s, T = c)}{P(W = s, T = c) + P(W = r, T = c)} \\
 &= \frac{0.2}{0.2 + 0.3} = 0.4
 \end{aligned}$$

$P(T, W)$

T	W	P
hot	sun	0.4
hot	rain	0.1
cold	sun	0.2
cold	rain	0.3

**SELECT** the joint probabilities matching the evidence

$P(c, W)$

cold	sun	0.2
cold	rain	0.3

**NORMALIZE** the selection (make it sum to one)

$P(W|T = c)$

W	P
sun	0.4
rain	0.6

$$\begin{aligned}
 P(W = r|T = c) &= \frac{P(W = r, T = c)}{P(T = c)} \\
 &= \frac{P(W = r, T = c)}{P(W = s, T = c) + P(W = r, T = c)} \\
 &= \frac{0.3}{0.2 + 0.3} = 0.6
 \end{aligned}$$

# Normalization Trick

$P(T, W)$

T	W	P
hot	sun	0.4
hot	rain	0.1
cold	sun	0.2
cold	rain	0.3

**SELECT** the joint

probabilities  
matching the  
evidence

$P(c, W)$

T	W	P
cold	sun	0.2
cold	rain	0.3

**NORMALIZE** the  
selection  
(make it sum to one)

$P(W|T = c)$

W	P
sun	0.4
rain	0.6

- Why does this work? Sum of selection is  $P(\text{evidence})!$  ( $P(T=c)$ , here)

$$P(x_1|x_2) = \frac{P(x_1, x_2)}{P(x_2)} = \frac{P(x_1, x_2)}{\sum_{x_1} P(x_1, x_2)}$$

# Quiz: Normalization Trick

■  $P(X \mid Y=-y)$  ?

$P(X, Y)$

X	Y	P
+x	+y	0.2
+x	-y	0.3
-x	+y	0.4
-x	-y	0.1

**SELECT** the joint probabilities matching the evidence  
**NORMALIZE** the selection (make it sum to one)

<https://tutorcs.com>  
WeChat: cstutorcs

# Probabilistic Inference

- Probabilistic inference: compute a desired probability from other known probabilities (e.g. conditional from joint)

Assignment Project Exam Help

- We generally compute conditional probabilities
  - $P(\text{on time} \mid \text{no reported accidents}) = 0.90$
  - These represent the agent's *beliefs* given the evidence

- Probabilities change with new evidence:
  - $P(\text{on time} \mid \text{no accidents, 5 a.m.}) = 0.95$
  - $P(\text{on time} \mid \text{no accidents, 5 a.m., raining}) = 0.80$
  - Observing new evidence causes *beliefs to be updated*

# Inference by Enumeration

- General case:

- Evidence variables:  $E_1 \dots E_k = e_1 \dots e_k$
  - Query\* variable:  $Q$
  - Hidden variables:  $H_1 \dots H_r$
- $\left. \begin{array}{l} E_1 \dots E_k = e_1 \dots e_k \\ Q \\ H_1 \dots H_r \end{array} \right\} \begin{array}{l} X_1, X_2, \dots X_n \\ \text{All} \\ \text{variables} \end{array}$

- We want:

$$P(Q|e_1 \dots e_k)$$

*\* Works fine with multiple query variables, too*

- Step 1: Select the entries consistent with the evidence

- Step 2: Sum out H to get joint of Query and evidence

- Step 3: Normalize

x	P(x)
-3	0.05
-1	0.25
0	0.07
1	0.2
5	0.01

2

0.15

WeChat: cstutorcs

$$\times \frac{1}{Z}$$

$$Z = \sum_q P(Q, e_1 \dots e_k)$$

$$P(Q|e_1 \dots e_k) = \frac{1}{Z} P(Q, e_1 \dots e_k)$$

$$P(Q, e_1 \dots e_k) = \sum_{h_1 \dots h_r} P(Q, \underbrace{h_1 \dots h_r, e_1 \dots e_k}_{X_1, X_2, \dots X_n})$$

# Inference by Enumeration

■  $P(W)$ ?

■  $P(W \mid \text{winter})$ ?

■  $P(W \mid \text{winter, hot})$ ?

Assignment Project Exam Help

<https://tutorcs.com>

WeChat: cstutorcs

summer	hot	rain	0.05
summer	cold	sun	0.10
summer	cold	rain	0.05
winter	hot	sun	0.10
winter	hot	rain	0.05
winter	cold	sun	0.15
winter	cold	rain	0.20

# Inference by Enumeration

---

- Obvious problems:

- Worst-case time complexity  $O(d^n)$
- Space complexity  $O(d^n)$  to store the joint distribution

Assignment Project Exam Help

<https://tutorcs.com>

WeChat: cstutorcs

# The Product Rule

- Sometimes have conditional distributions but want the joint

$$P(y)P(x|y) = P(x, y) \quad \longleftrightarrow \quad P(x|y) = \frac{P(x, y)}{P(y)}$$

<https://tutorcs.com>

WeChat: cstutorcs

# The Product Rule

$$P(y)P(x|y) = P(x, y)$$

Assignment Project Exam Help

- Example:

$P(W)$

R	P
sun	0.8
rain	0.2

$P(D|W)$

D	W	P
wet	sun	0.1
dry	sun	0.9
wet	rain	0.7
dry	rain	0.3

$P(D, W)$

D	W	P
wet	sun	
dry	sun	
wet	rain	
dry	rain	

<https://tutorcs.com>

WeChat: cstutorcs

# The Chain Rule

---

- More generally, can always write any joint distribution as an incremental product of conditional distributions

$$P(x_1, x_2, x_3) = P(x_1)P(x_2|x_1)P(x_3|x_1, x_2)$$

$$P(x_1, x_2, \dots, x_n) = \prod_i P(x_i|x_1 \dots x_{i-1})$$

- Why is this always true?

# Bayes Rule

---

# Bayes Rule

- Two ways to factor a joint distribution over two variables:

$$P(x, y) = P(x|y)P(y) = P(y|x)P(x)$$

Assignment Project Exam Help

That's my rule!

- Dividing, we get:

$$P(x|y) = \frac{P(y|x)P(x)}{P(y)}$$

<https://tutorcs.com>

WeChat: cstutorcs

- Why is this at all helpful?
  - Lets us build one conditional from its reverse
  - Often one conditional is tricky but the other one is simple
- In the running for most important AI equation!

# Quiz

- Given:

$P(W)$	
R	P
sun	0.8
rain	0.2

$$P(D|W)$$

D	W	P
wet	sun	0.1
dry	sun	0.9
wet	rain	0.7
dry	rain	0.3

Assignment Project Exam Help

<https://tutorcs.com>

WeChat: cstutorcs

- What is  $P(W \mid \text{dry})$  ?

# Inference with Bayes' Rule

- Example: Diagnostic probability from causal probability:

$$P(\text{cause}|\text{effect}) = \frac{P(\text{effect}|\text{cause})P(\text{cause})}{P(\text{effect})}$$

Assignment Project Exam Help

- Example:

- M: meningitis, S: stiff neck

<https://tutorcs.com>

$$\left. \begin{aligned} P(+m) &= 0.0001 \\ P(+s|+m) &= 0.8 \\ P(+s|-m) &= 0.01 \end{aligned} \right\}$$

Example  
givens

$$P(+m|+s) = \frac{P(+s|+m)P(+m)}{P(+s)} = \frac{P(+s|+m)P(+m)}{P(+s|+m)P(+m) + P(+s|-m)P(-m)} = \frac{0.8 \times 0.0001}{0.8 \times 0.0001 + 0.01 \times 0.999}$$

- Note: posterior probability of meningitis still very small
  - Note: you should still get stiff necks checked out! Why?
