Announcement

- Project 1
 - Deadline: Oct 13th, 2020
- Written Assignment 1
 - Will be posted today
 - Deadline: Oct 10th, 2020

Today

- Agents that Plan Ahead

- Search Problems

Assignment Project Exam Help

<https://tutorcs.com>

- Uninformed Search Methods

WeChat: cstutorcs

- Depth-First Search

- Breadth-First Search

- Uniform-Cost Search

Rational Agents

- An **agent** is an entity that *perceives* and *acts*.
- A **rational agent** selects actions that maximize its **utility function**.
- Characteristics of the **percepts**, **environment**, and **action space** dictate techniques for selecting rational actions.

Reflex Agents

- Reflex agents:
 - Choose action based on current percept (and maybe memory)
 - Do not consider future consequences of their actions
 - Consider how the world is
- Can a reflex agent be rational?

Video of Demo Reflex Odd

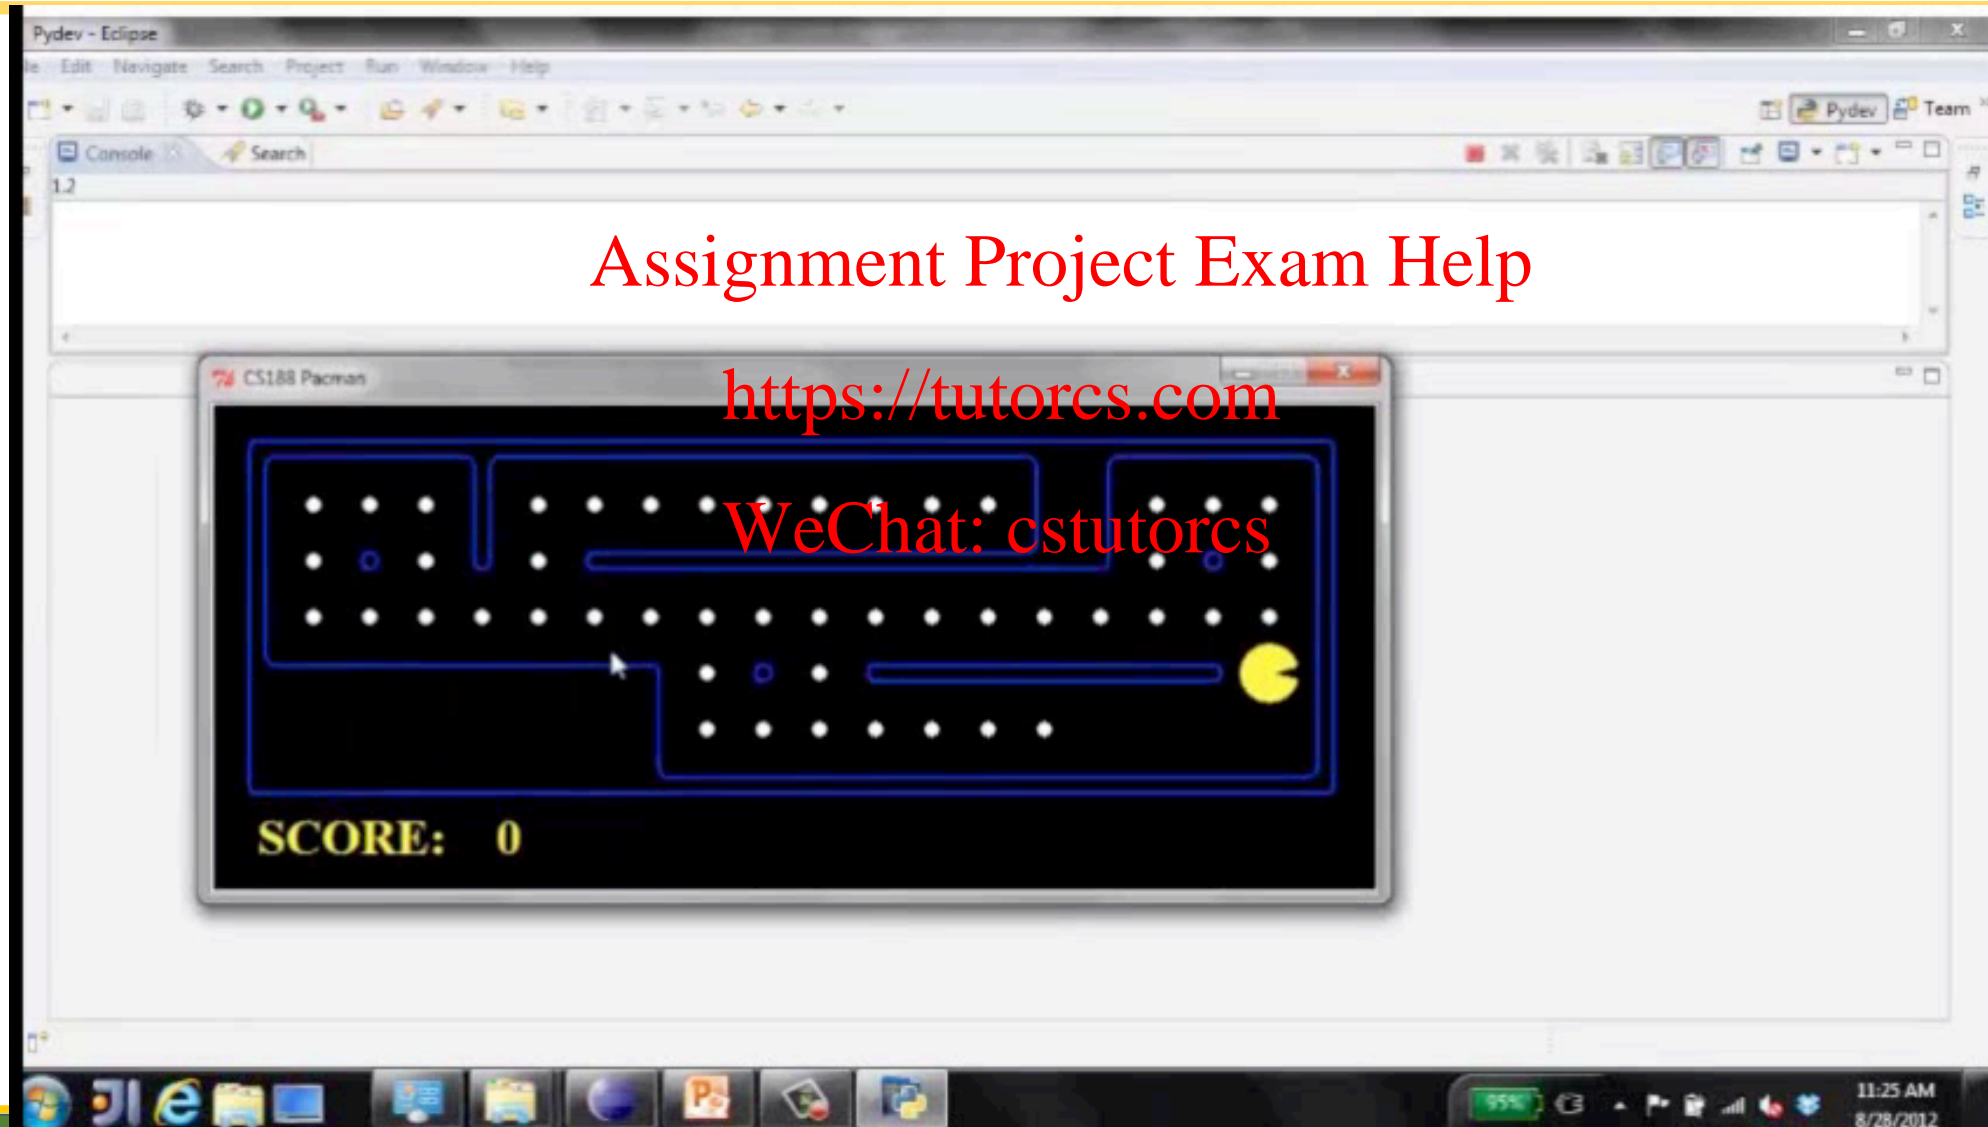

Goal-based Agents

- Goal-based agents:

- Plan ahead
- Ask “what if”
- Decisions based on (hypothesized) consequences of actions
- Must have a model of how the world evolves in response to actions
- **Act on how the world WOULD BE**

Video of Demo Mastermind

Search Problem

- A **search problem** consists of:

- A state space

Assignment Project Exam Help

<https://tutorcs.com>

- A successor function
(with actions, costs)

WeChat: cstutores

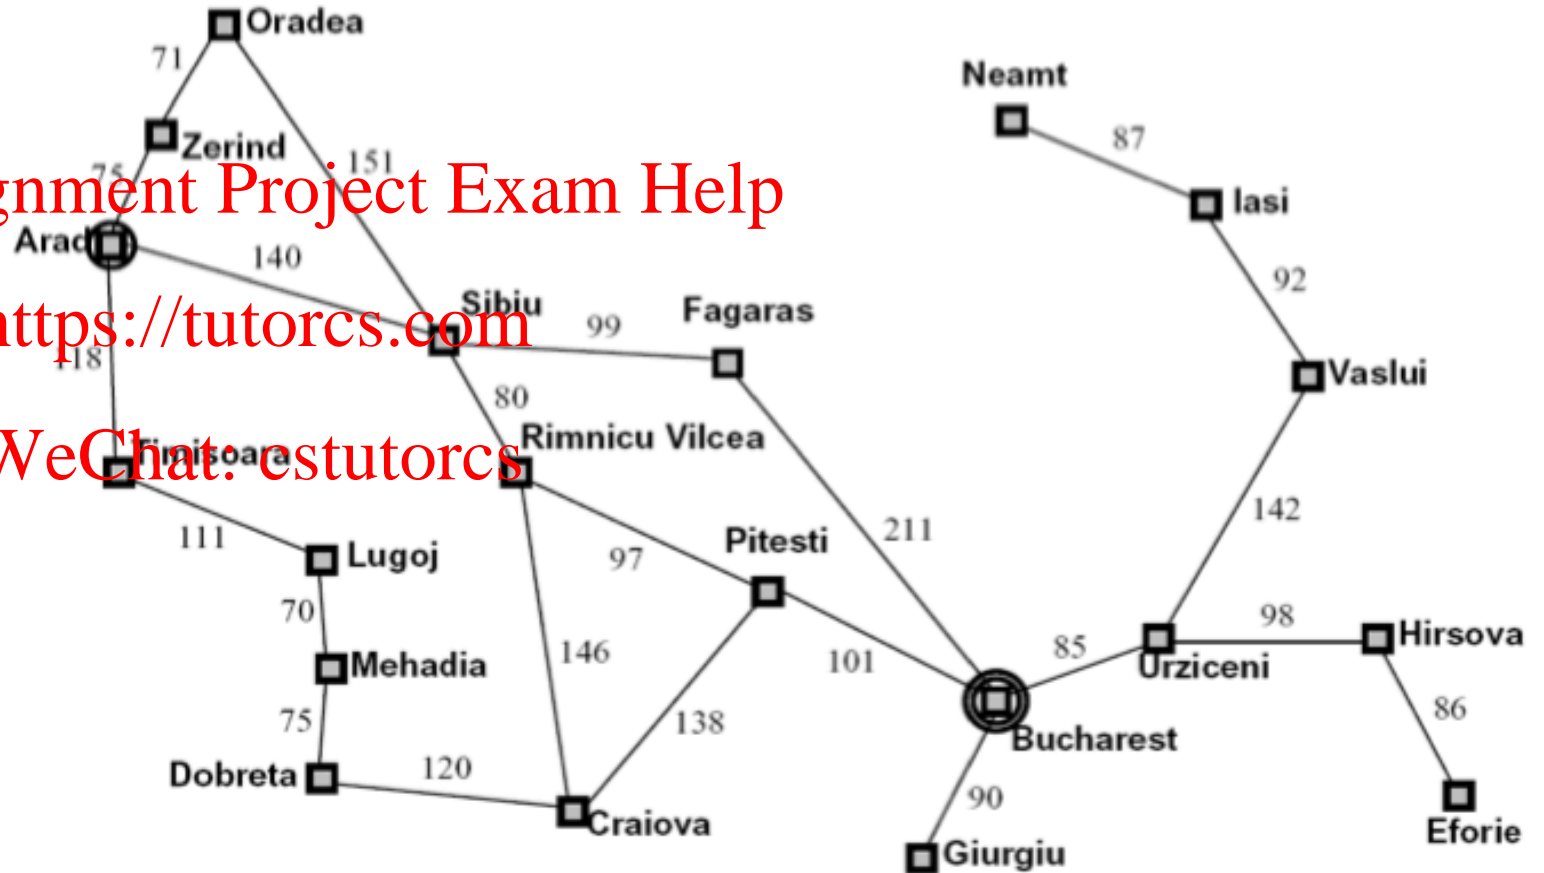

- A start state and a goal test

- A **solution** is a sequence of actions (a plan) which transforms the start state to a goal state

Example: Romania

- State space:
 - Cities
- Successor function:
 - Go to adj city with cost = dist
- Start state:
 - Arad
- Goal test:
 - Is state == Bucharest?
- Solution?

What is in State Space

The **world state** includes every last detail of the environment

WeChat: cstutorcs

- Problem: Pathing
 - States: (x,y) location
 - Actions: NSEW
 - Successor: update location only
 - Goal test: is $(x,y)=\text{END}$
- Problem: Eat-All-Dots
 - States: $\{(x,y), \text{dot booleans}\}$
 - Actions: NSEW
 - Successor: update location and possibly a dot boolean
 - Goal test: dots all false

State Space Size

- Search Problem:
Eat all of the food
- Pacman positions: $10 \times 12 = 120$
- Pacman facing: up, down, left, right
- Food Count: 30
- Ghost positions: 12
- How many
- World states? $120 \times (2^{30}) \times (12^2) \times 4$
- States for pathing? 120
- States for eat-all-dots? $120 \times (2^{30})$

State Space Graphs

- State space graph: A mathematical representation of a search problem
 - Nodes are (abstracted) world configurations
 - Arcs represent successors (action results)
 - The goal test is a set of goal nodes (maybe only one)
- In a state space graph, each state occurs only once!
- We can rarely build this full graph in memory (it's too big), but it's a useful idea

State Space Graphs

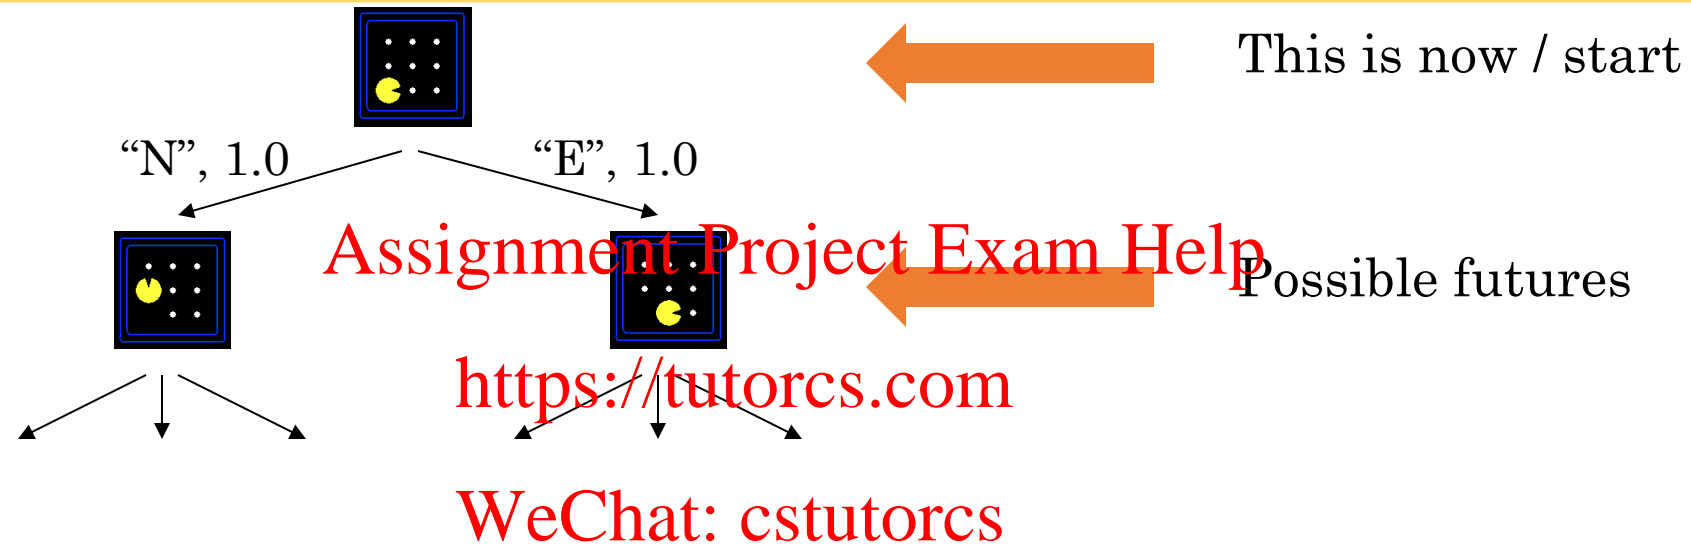

- State space graph: A mathematical representation of a search problem
 - Nodes are (abstracted) world configurations
 - Arcs represent successors (action results)
 - The goal test is a set of goal nodes (maybe only one)
- In a state space graph, each state occurs only once!
- We can rarely build this full graph in memory (it's too big), but it's a useful idea

Tiny state space graph for a tiny search problem

Search Trees

- A search tree:
 - A “what if” tree of plans and their outcomes
 - The start state is the root node
 - Children correspond to successors
 - Nodes show states, but correspond to PLANS that achieve those states
 - For most problems, we can never actually build the whole tree

State Space Graphs vs. Search Trees

State Space Graph

*Each NODE in
in the search tree*

*is an entire
PATH in the*

*state space
graph.*

WeChat: cstutorcs

*We construct both
on demand – and
we construct as
little as possible.*

Search Tree

Quiz: State Space Graphs vs. Search Trees

Consider this 4-state graph:

How big is its search tree (from S)?

WeChat: cstutorcs

Important: Lots of repeated structure in the search tree!

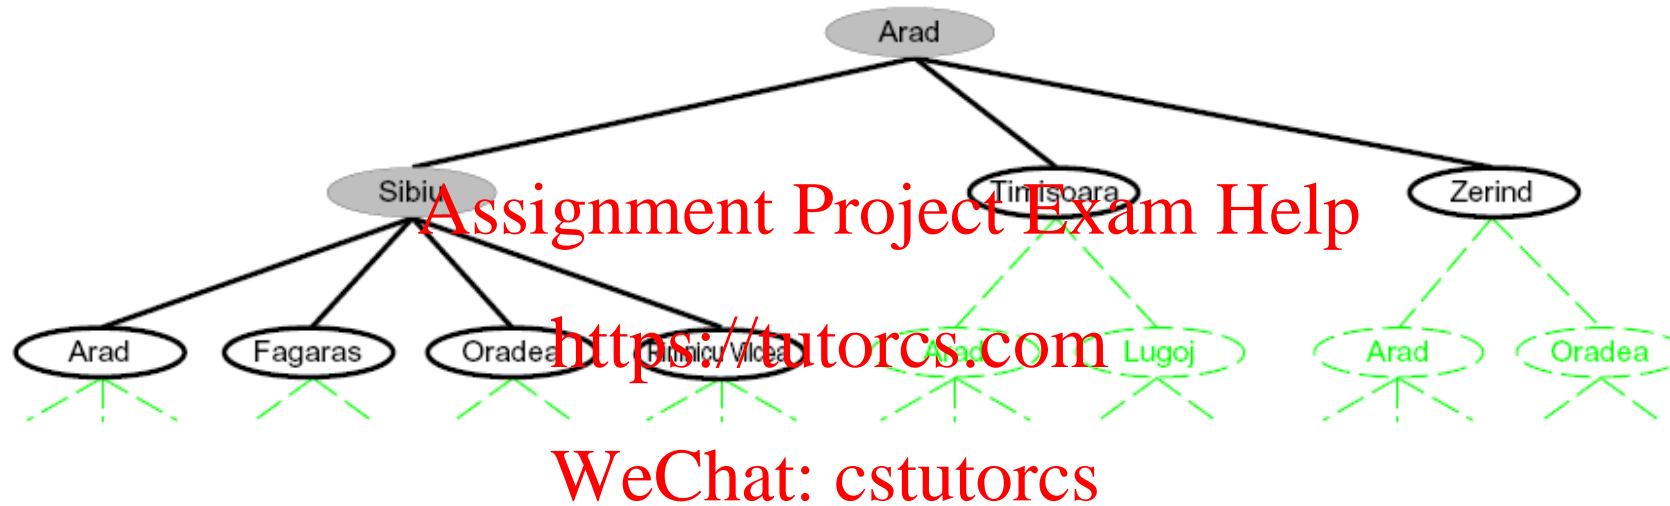

Tree Search

Search Example: Romania

Searching with a Search Tree

- Search:
 - Expand out potential plans (tree nodes)
 - Maintain a **fringe** of partial plans under consideration
 - Try to expand as few tree nodes as possible

General Tree Search

- Tree Search
 - Initialize the *root node* of the search tree with the *start state*
 - While there are unexpanded leaf nodes (fringe):
 - Choose a leaf node (strategy)
 - If the node contains a goal state:
return the corresponding solution
 - Else: expand the node and add its children to the tree
- Important ideas:
 - Fringe
 - Expansion
- Strategy: which fringe nodes to explore?

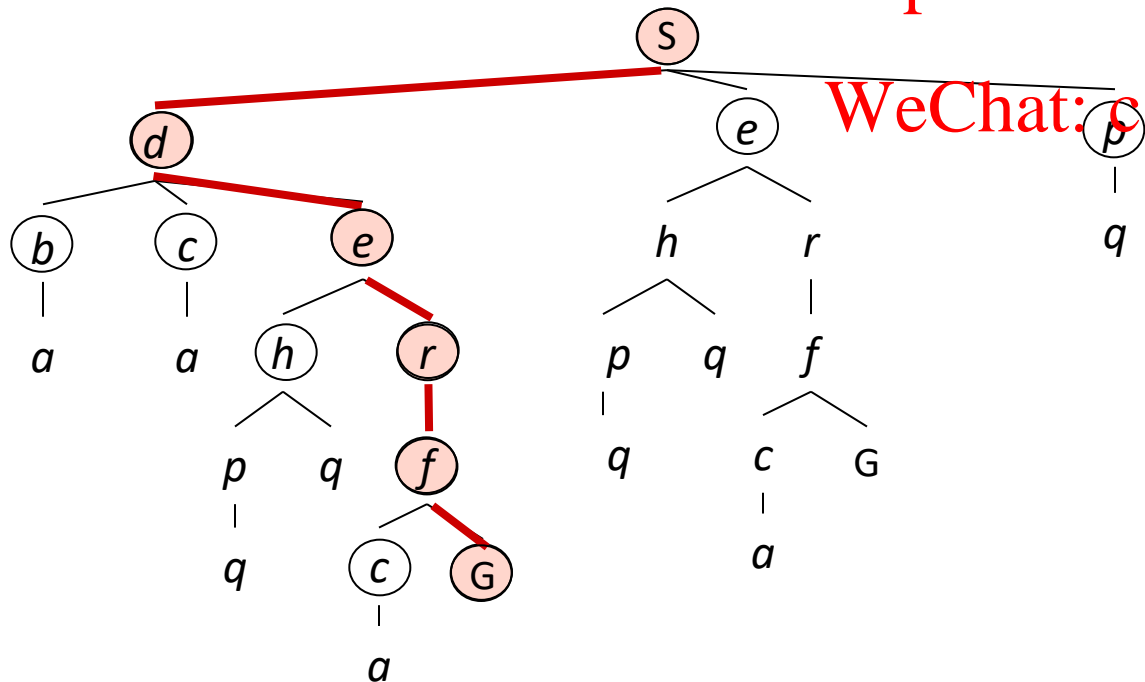

Example: Tree Search

~~§~~

~~s → d~~
$$s \rightarrow e$$
$$s \rightarrow p$$
$$s \rightarrow d \rightarrow b$$
$$s \rightarrow d \rightarrow c$$
 ~~$s \rightarrow d \rightarrow e$~~
$$s \rightarrow d \rightarrow e \rightarrow h$$
 ~~$s \rightarrow d \rightarrow e \rightarrow r$~~

~~s → d → e → r → f~~

$$s \rightarrow d \rightarrow e \rightarrow r \rightarrow f \rightarrow c$$
 ~~$s \rightarrow d \rightarrow e \rightarrow r \rightarrow f \rightarrow G$~~ 

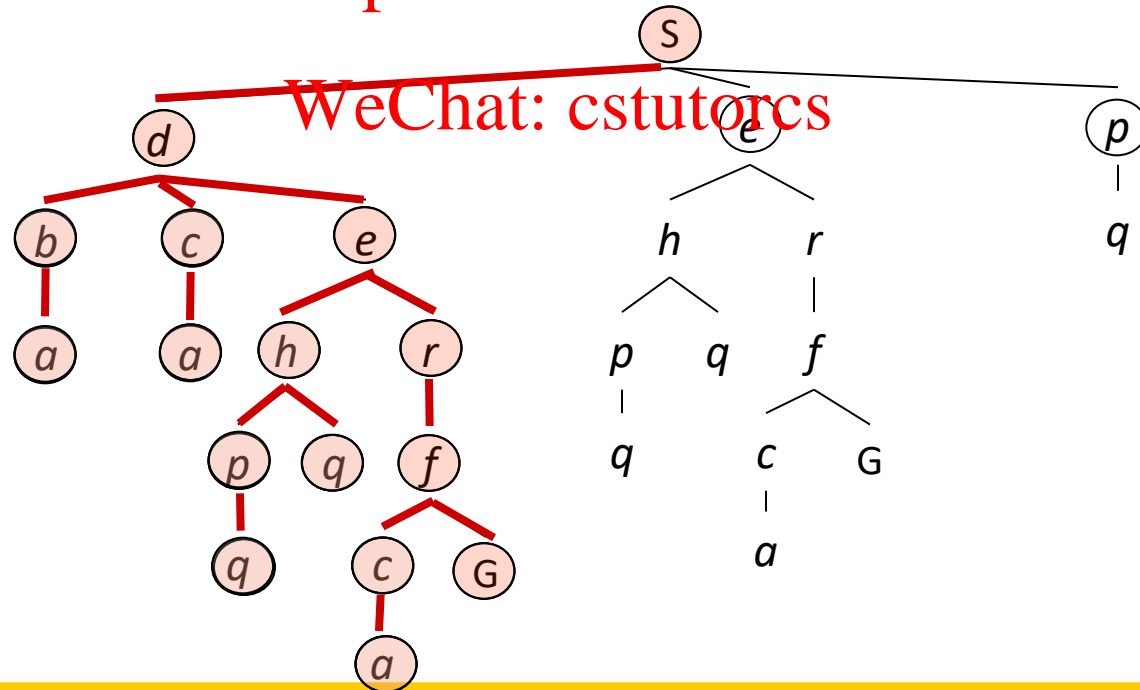

Depth-First Search (DFS)

Depth-First Search (DFS)

Strategy: expand a deepest node first

Implementation: Fringe is a LIFO stack

Search Algorithm Properties

- Complete: Guaranteed to find a solution if one exists?
- Optimal: Guaranteed to find the least cost path?
- Time complexity?
- Space complexity?

Assignment Project Exam Help

<https://tutorcs.com>

WeChat: estutorcs

- Cartoon of search tree:
 - b is the branching factor
 - m is the maximum depth
 - solutions at various depths

- Number of nodes in entire tree?
 - $1 + b + b^2 + \dots + b^m = O(b^{m+1})$

DFS Properties

- What nodes DFS expand?
 - Some left prefix of the tree.
 - Could process the whole tree!
 - If m is finite, takes time $O(b^m)$
- How much space does the fringe take?
 - Only has siblings on path to root, so $O(bm)$
- Is it complete?
 - m could be infinite, so only if we prevent cycles (more later)
- Is it optimal?
 - No, it finds the “leftmost” solution, regardless of depth or cost

Breadth-First Search (BFS)

Breadth-First Search (BFS)

Strategy: expand a shallowest node first

*Implementation:
Fringe is a FIFO queue*

<https://tutorcs.com>

BFS Properties

- What nodes does BFS expand?
 - Processes all nodes above shallowest solution
 - Let depth of shallowest solution be s
 - Search takes time $O(b^s)$

Assignment Project Exam Help

<https://tutorcs.com>

WeChat: cstutorcs

- How much space does the fringe take?
 - $O(b^{s+1})$

- Is it complete?
 - s must be finite if a solution exists, so yes!

- Is it optimal?
 - Only if costs are all 1 (more on costs later)

DFS vs BFS

- When will BFS outperform DFS?
Assignment Project Exam Help
<https://tutorcs.com>
- When will DFS outperform BFS?
WeChat: cstutorcs

Iterative Deepening

- Idea: get DFS's space advantage with BFS's time / shallow-solution advantages

Assignment Project Exam Help

- Run a DFS with depth limit 1. If no solution...
- Run a DFS with depth limit 2. If no solution...
- Run a DFS with depth limit 3.

<https://tutorcs.com>

WeChat: tutorcs

- Isn't that wastefully redundant?
 - Generally most work happens in the lowest level searched, so not so bad!
